LOCATION OF THE 1966
SOYBEAN PERFORMANCE TESTS

ACKNOWLEDGMENT

Acknowledgment is made to the Owensboro Grain Company, Owensboro, and the Ellis Elevator Company and Henderson Elevator Company, Henderson, for their cooperation in the soybean tests at Henderson; also to county agents and others who assisted in conducting the tests. Special acknowledgment is made to farmer cooperators Allan and Joe Toy, Henderson; Bun Hughes, Murray and Robert Sanger, Hickman.

| <u>Location</u> | <u>Soil Type</u> | <u>pH</u> | <u>Phos- phorus</u> | <u>Po- tassium</u> |
|-----------------|-----------------------|-----------|-------------------------|------------------------|
| 1. Henderson | Falaya silt loam | 5.92 | High | Low |
| 2. Princeton | Huntington silt loam | 7.4 | High | Low |
| 3. Murray | Grenada silt loam | 6.2 | Medium | Medium |
| 4. Hickman | Robinsville silt loam | 7.0 | High | High |

RESULTS OF THE KENTUCKY SOYBEAN
PERFORMANCE TESTS - 1966

The objective of the Kentucky Soybean Performance tests is to provide an estimate of the relative performance of standard soybean varieties and to provide information on the performance of improved strains of soybeans in the U. S. Regional Soybean Laboratory Tests. Included in the testing program are herbicide tests, row-spacing tests and fertilizer tests.

Soybean production in Kentucky for 1966 was estimated at 7,750,000 bushels. Production in 1965 was 7,080,000 bushels and 5,185,000 bushels for the period 1960-64. Average yields per acre were 25 bushels for 1966, 24.0 bushels for 1965 and 23.6 bushels for 1960-64.

EXPERIMENTAL METHODS

Soybean tests were conducted at four locations in the major soybean-producing areas of the state. The testing locations are shown on the map on page 2. The field at Henderson was planted on June 2, that at Princeton May 11, Murray on May 13 and Hickman on May 30.

Field Designs

Varieties and experimental strains were planted in three plots at all locations with individual plots being 4 rows wide and 19 feet long. The seeding rate was 10 viable seed or 12 seed per foot of row.

In the row-spacing test the planting rate was 10 viable seed per foot of row with rows spaced 20, 30 and 40 inches apart. In the Henderson test, only the 20 and 40 inch rows were harvested. Morning glory growth was heavy in the Amsoy plots, moderate in the Clark 63 plots and light in the Hood plots at Henderson. Plants in the Amsoy plots were all down badly, Clark 63 plants were leaning considerably, and Hood plants were all erect. At Princeton Clark 63 was significantly higher yielding than Amsoy and Hood. Row spacing was not significant.

At Henderson Clark 63 in 20 inch rows was significantly higher yielding than Clark 63 in 40 inch rows and Amsoy and Hood in 20 and 40 inch rows. Amsoy 20 inch rows were significantly higher yielding than Amsoy and Hood 40 inch rows. Morning glory growth was heavy in Amsoy plots, moderate in Clark 63 plots, and very light in Hood plots.

Weed Control Experiments

Herbicides were applied with a tractor mounted boom sprayer. Chemicals were applied uniformly by using a constant pressure at 40 psi. All chemicals were applied in water at the rate of 25 gal/A. Treflan was applied as a preplant treatment and double disked immediately into the soil. All treatments gave commercially satisfactory control of grassy weeds. None controlled morning glory (Ipomoea purpurea).

Plot size at Henderson and Hickman was 4 rows 40 feet long. There were no weeds present in the Hickman test which was not harvested for yield. There were no statistically significant differences in yield at Henderson.

Weed control ratings for the Henderson test are presented in Table 9.

Yield

A 16-foot section from each of the 2 center rows was harvested for yield. Plants were cut by hand and threshed with a small nursery thresher. The yield of the varieties is reported as bushels per acre at 13.0 percent moisture.

Date Matured

The date when the pods are dry and most of the leaves have dropped. Stems are also dry, under most conditions. Maturity may also be expressed as days earlier (-) or later (+) than a standard variety.

Lodging

Lodging is based on a scale of 1 to 5: 1 = almost all plants erect; 2 = all plants over slightly or a few down; 3 = all plants over moderately or 25%-50% down; 4 = all plants over considerably or 50%-80% down; 5 = all plants down badly.

Seed Quality

Quality is also based on a scale of 1 to 5: 1 = very good; 2 = good; 3 = fair; 4 = poor; 5 = very poor.

Purple Stain

The amount of purple stain is expressed as the percentage of seeds which are stained.
